

# Managing pile-up in SICBDST

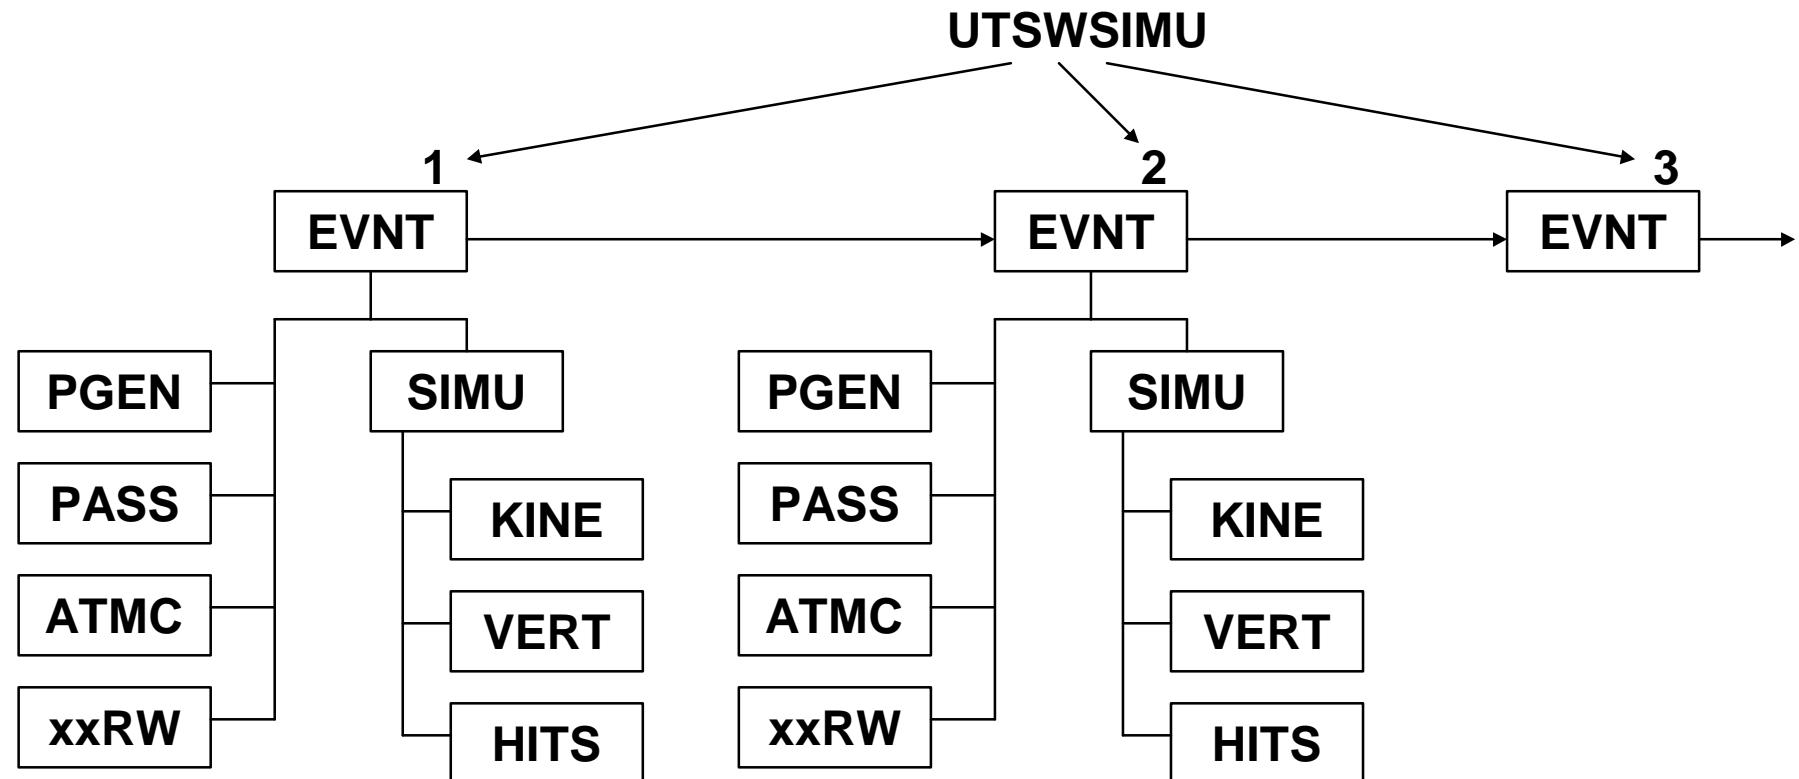

## ◆ **Outline**

- Pile-up in SICB
- Pile-up in SICBDST
- Status

# Pile-up in SICB

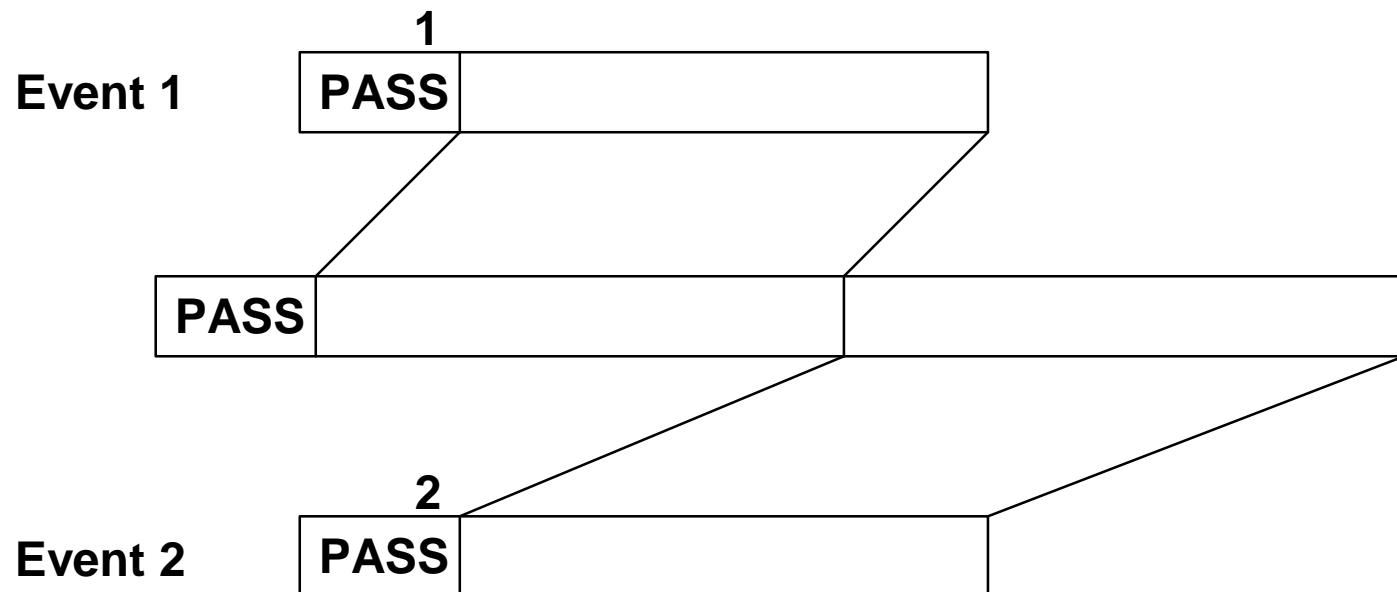

# New pile-up scheme

# Pile-up in SICBDST

PASS bank contains multiple objects after merging

## Pile-up in SICBDST (2)

ATMC, AVMC, PGEN become multipartition banks

Event 1

1

2

ATMC

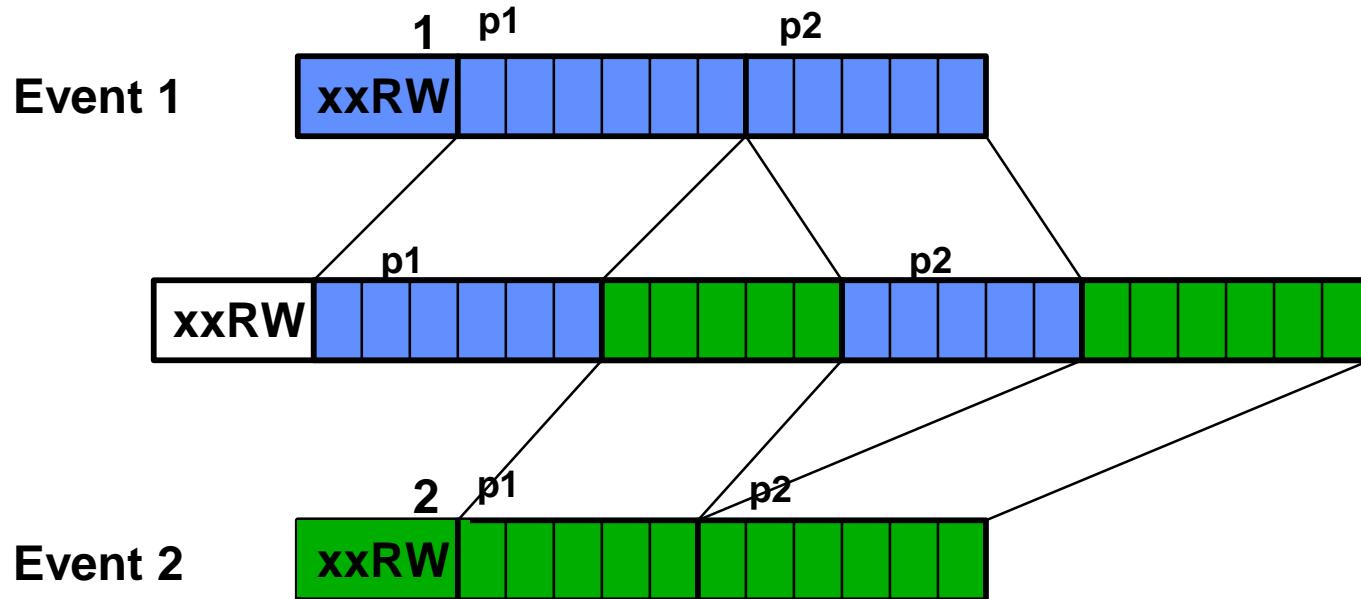

Event 2

## Pile-up in SICBDST (3)

RW banks have partitions with objects from different events

# Pile-up in SICBDST (4)

## ◆ References retained

- ATMC → PGEN
- ATMC ↔ AVMC
- ATMC ↔ xxRW

# Pile-up in SICBDST (5)

## ◆ Features

- all the pile-up events information is retained (**PASS, PGEN** banks);
- works transparently for a user, need no special subdetector code
  - assumes a certain structure of a RW bank:
    - ◆ the first reference type is → ATMC
- works both with MC and RW data formats;

# Status

- ◆ **Compiled and checked with SICB v223**
- ◆ **Compilation and test with SICBDST v230 is to be done**
  - will be only released with SICBDST
- ◆ **Need a careful test by all the subdetector experts together with other SICBDST features**
  - RW banks integrity;
  - valid references.
